This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

Claim 1 (canceled):

Claim 2 (currently amended): A method of producing a high frequency circuit chip according to claim 45, wherein the conductor layer is formed by applying and firing electrically conductive paste.

β1 Claim 3 (currently amended): A method of producing a high frequency circuit chip according to claim 45, further comprising the steps of:
forming a protection film so as to cover the wiring pattern on the substrate, and
cutting the substrate along desired dicing lines to obtain the high frequency circuit chip.

Claim 4 (currently amended): A method of producing a high frequency circuit chip according to claim 45, further comprising a step of forming a thin-film resistor pattern which is connected to the wiring pattern.

Claim 5 (currently amended): A method of producing a high frequency circuit chip having a substrate made of a ceramic with a high dielectric constant, a wiring pattern provided on one main surface of the substrate, an electric conductor layer provided on substantially all of another main surface of the substrate, and a through-hole including a connecting electrode for connecting the wiring pattern and the conductor layer to each other, the method comprising the steps of:

filling electrically conductive paste into a perforation in the substrate, and firing the paste to form the connecting electrode of the through-hole;

forming a resist pattern with an opening having a desired shape and size directly on the substrate;

Serial No. 10/087,915

forming a thin film with a wiring material directly on the substrate through the opening over the resist pattern after forming the resist pattern;

removing the unnecessary wiring material thin film deposited on the resist pattern together with the resist pattern to form the wiring pattern directly on the substrate by a lift-off method;~~according to claim 1, further comprising the steps of:~~

mirror-polishing at least the surface of the fired substrate on which the wiring pattern is formed, and the fired substrate in which the through-hole having the connecting electrode is formed; and

thereafter forming the wiring pattern on the mirror-polished surface by the lift-off method.

B1
Claim 6 (currently amended): A method of producing a high frequency circuit chip according to claim 45, wherein the substrate has a relative dielectric constant of at least about 10.

Claim 7 (currently amended): A method of producing a high frequency circuit chip according to claim 45, includes the step of forming the wiring pattern formed on at least one main surface of the substrate and the electric conductor layer formed on substantially all of the other main surface by a conductor pattern containing at least one metal selected from the group consisting of Ag, Cu, and Al as a major component and having a thickness of at least about 2 μm .

Claim 8 (currently amended): A method of producing a high frequency circuit chip according to claim 45, wherein the connecting electrode of the through-hole is formed by electrically conductive paste including at least one metal selected from the group consisting of Ag, Cu, and Al as a major component.

9. (canceled)

Claim 10 (currently amended): A method of producing a high frequency circuit chip having a substrate made of a ceramic having a high dielectric constant, a wiring pattern disposed on each of front and back main surfaces of the substrate, and a through-hole including a connecting electrode for connecting the wiring patterns disposed on the front and back main surfaces of the substrate, the method comprising the steps of:

filling electrically conductive paste into a perforation in the substrate, and firing the paste to form the connecting electrode of the through-hole;

forming a resist pattern with an opening having a predetermined shape and size directly on the substrate;

forming a thin film with a wiring material directly on the substrate through the opening over the resist pattern after forming the resist pattern; and

removing the unnecessary wiring material thin film deposited on the resist pattern together with the resist pattern to form each wiring pattern directly on the substrate by the lift-off method;

mirror-polishing at least the surface of the fired substrate on which the wiring pattern is formed, and the fired substrate in which the through-hole having the connecting electrode is formed; and

thereafter forming the wiring pattern on the mirror-polished surface by the lift-off method.

11. (canceled)

Claim 12 (original): A method of producing a high frequency circuit chip according to claim 10, further comprising the step of forming the wiring patterns formed on both of the front and back main surfaces of the substrate by forming a conductor pattern including at least one metal selected from the group consisting of Ag, Cu, and Al as a major component and having a thickness of at least about 2 μm .
